

**IN THE ABSTRACT:**

Please amend the Abstract as follows:

**ABSTRACT**

**ELECTRONIC APPARATUS INCLUDING AN ANALOG DISPLAY DEVICE**

**FOR DISPLAYING ANY POSITION ON A DIAL**

The apparatus includes at least one information storing unit [[(23)]], a unit [[(25)]] for processing said information, a management and control unit [[(20)]] receiving control signals from the processing unit [[(25)]] and a supply unit [[(27)]] controlled by said management unit and controlling the movement of said two stepping motors [[(24;26)]] above a dial bearing markings  $R_i$  representative of said information.

The apparatus is characterized in that said processing unit [[(25)]] is provided with an algorithm or correspondence table between a marking  $R_i$  and angles  $\alpha_i \beta_i$  formed respectively by each hand [[(14, 16)]] from a measurement reference [[(13)]] and in that the shape of said hands [[(14, 16)]] is such that when they have the angular orientations  $\alpha_i \beta_i$ , their elongated parts can intersect above said marking  $R_i$ , or their tips can be aligned opposite said marking  $R_i$ .

The apparatus may be a wristwatch.
